

Department of Electronic and Telecommunication Engineering
University of Moratuwa

Practical Session 1

Wijetunga W.L.N.K - 200733D

This report is submitted as a partial fulfillment of the module

EN2150 – Communication Network Engineering

24nd of March 2023

Question (1) - What is a hierarchical network? Networks aggregating at different levels

b) Activate Wireshark packet capture and perform the following:

- I. Access each of the following web pages and then Ping and Traceroute to the same web pages. Copy the results to a file for later analysis.

- **www.uoregon.edu**

```
Command Prompt
C:\Users\Namina Wijetunga>ping www.uoregon.edu

Pinging www.uoregon.edu [2620:12a:8001::3] with 32 bytes of data:
Reply from 2620:12a:8001::3: time=84ms
Reply from 2620:12a:8001::3: time=108ms
Reply from 2620:12a:8001::3: time=102ms
Reply from 2620:12a:8001::3: time=95ms

Ping statistics for 2620:12a:8001::3:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 84ms, Maximum = 108ms, Average = 97ms

No information about the location could be obtained.

II. Analysing what happens during web page loading, ping and traceroute by observing the packet details in each of the Layers Within Wireshark captured packets

- Web page loading

The protocols involved in loading a web page include HTTP (Hypertext Transfer Protocol), TCP (Transmission Control Protocol), and DNS (Domain Name System).

The browser first needs to find the IP address of the web server hosting the website that want to access. It sends a DNS request to a DNS server to translate the domain name in the URL into an IP address.

Once the browser has the IP address, it establishes a TCP connection with the web server. This involves a three-way handshake process where the browser and server exchange messages to confirm that they can communicate with each other. The browser then sends an HTTP request to the server asking for the web page content. The server responds with an HTTP response that includes the requested web page content.

- Ping -

When the ping packet is sent, it contains a header with information about the sender, recipient, and the packet itself. The recipient device receives the packet, processes it, and sends a response packet back to the sender, indicating that it has received the packet and how long it took to process.

- Traceroute -

Traceroute program sends a series of packets with incrementally increasing time-to-live (TTL) values. The TTL value is decremented each time the packet passes through a router, and if the TTL reaches 0, the router drops the packet and sends an ICMP (Internet Control Message Protocol) error message back to the sender.

It records the information from the ICMP messages and displays it in a table or graph, showing the path that the packets took from the source to the destination.

III. Why do you get "*" * *" instead of IP addresses for some steps in traceroute?

Explanation -

This occurs when the network device that is responsible for the ongoing hop does not respond to the traceroute request. It can

happen due hardware issues of the network device, the network devices being too busy to respond, or the network device can be programmed so that the ICMP requests in can handle are limited. Therefore, some ICP requests can be dropped.

c) What does the PING indicate?

Explanation - PING indicates the connectivity between the sending and receiving devices of a network and determine the latency, or time delay, of the connection.

I. **Theoretical round trip time** to each from the current location

$$\text{Theoretical Round Trip Time} = \frac{\text{Distance}}{\text{Speed of Light}} \times 2$$

The location where the practical was conducted was Trincomalee, Sri Lanka. Assume that the speed of light in a vacuum is 299,792.458 km/s.

- **www.ruh.ac.lk**

Approximate distance to University of Ruhuna from Trincomalee - 399 km

Theoretical Round Trip Time - 2.6618 ms

- **www.uoregon.edu**

Approximate distance to University of Oregon from Trincomalee - 15,414 km

Theoretical Round Trip Time - 102.8311 ms

- **www.keio.ac.jp**

Approximate distance to Keio University from Trincomalee - 5,945 km

Theoretical Round Trip Time - 39.6608 ms

- **Japan.go.jp**

Approximate distance to Tokyo from Trincomalee - 6,620 km

Theoretical Round Trip Time - 44.1639 ms

- **nsf.gov**

Approximate distance to National Science Foundation, Virginia from Trincomalee - 14,900 km

Theoretical Round Trip Time - 99.4021 ms

- **www.cam.ac.uk**

Approximate distance to University of Cambridge from Trincomalee - 9,385 km

Theoretical Round Trip Time - 62.0998 ms

- **www5.usp.br**

Approximate distance to University of San Paulo, Brazil from Trincomalee - 18,065 km

Theoretical Round Trip Time - 120.5167 ms

- **www.unimelb.edu.au**

Approximate distance to University of Melbourne from Trincomalee - 6,875 km

Theoretical Round Trip Time - 45.8651 ms

II. Comparison of the Theoretical Round Trip Time and the measured Ping Time

	Theoretical round trip time (in milliseconds)	Measured average ping time (in milliseconds)
www.ruh.ac.lk	2.6618	Request timed out
www.uoregon.edu	102.8311	97
www.keio.ac.jp	39.6608	141
Japan.go.jp	44.1639	132
nsf.gov	99.4021	348
www.cam.ac.uk	62.0998	309
www5.usp.br	120.5167	423
www.unimelb.edu.au	45.8651	37

Explanation -

- The actual route travelled by the packets is not a straight line and they are undergoing so many processes on the way to the destination.
- More the number of devices they have to go through (Examples such as switches, routers) more processes will happen, and more processing delays will encounter.
- Additionally, the speed of light inside the fibre is less than the speed of light inside a vacuum which will take more time to reach the destination.

III. Can you identify sub-components that contribute to PING time?

- Quality of the ISP.
- Speed of the Internet connection.
- Firewall configuration.

- Geographical location.
- Bandwidth.

Question (2) - Why is bandwidth (throughput) important?

Explanation -

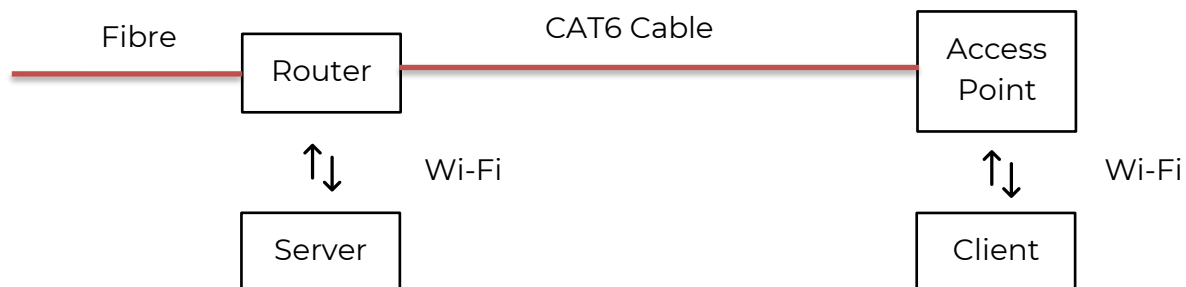

- Bandwidth is a measure of the amount of data that can be transmitted over a network in a given time period.
- Higher the bandwidth, more data can be transmitted, and it is important when multiple devices are trying to access the same Wi-Fi or Hotspot.
- It will reduce the latency which will reduce the response time for a given request.
- But increasing the bandwidth causes the cost of the network to increase as well.
- Therefore, it is important to manage the bandwidth when designing a efficient and a user friendly network.

Performing iperf3 bandwidth test

iperf3: error - unable to connect to server: Connection timed out

```

Observations and Comments:

- The bandwidth of the client and server which are connected to the same network is higher than the bandwidth of the public server and the remote client.
- The bandwidth during the peak traffic time is much lesser than the bandwidth during the off-peak traffic time.
- When connected to the network at University of Moratuwa during the peak traffic time, for some public servers, the connection timed out which the reason being too many users in the network trying to access the network at same time.

Question (3) - Why is latency important?

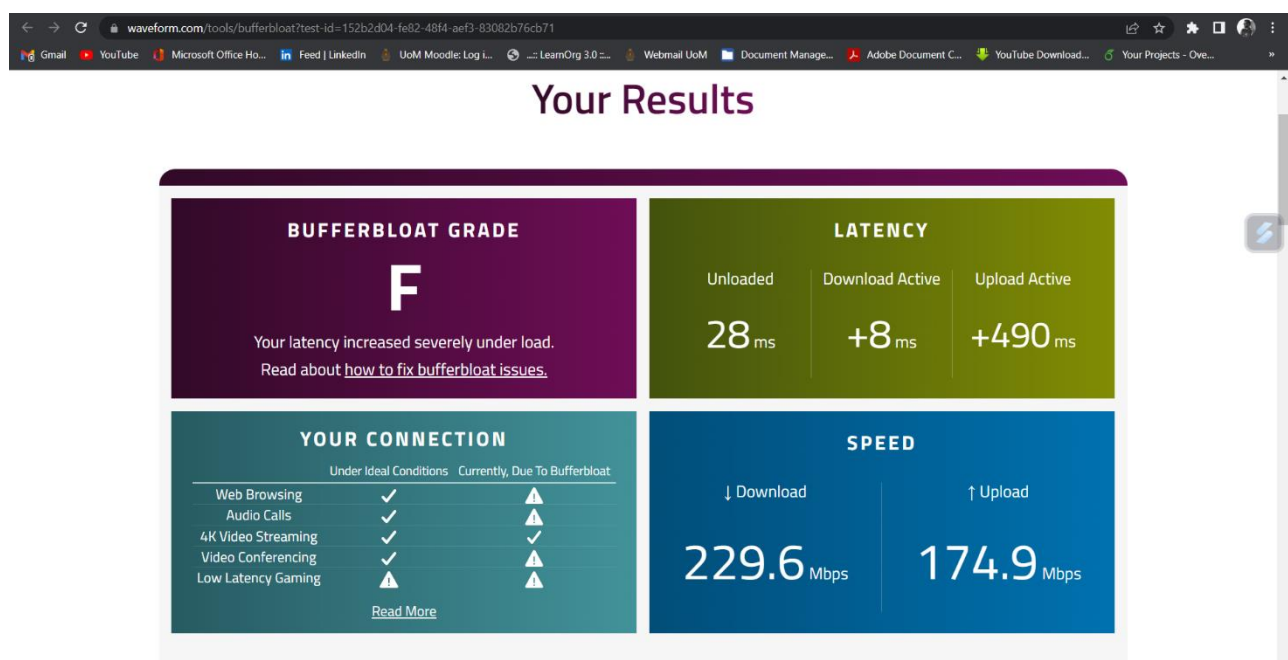

Explanation -

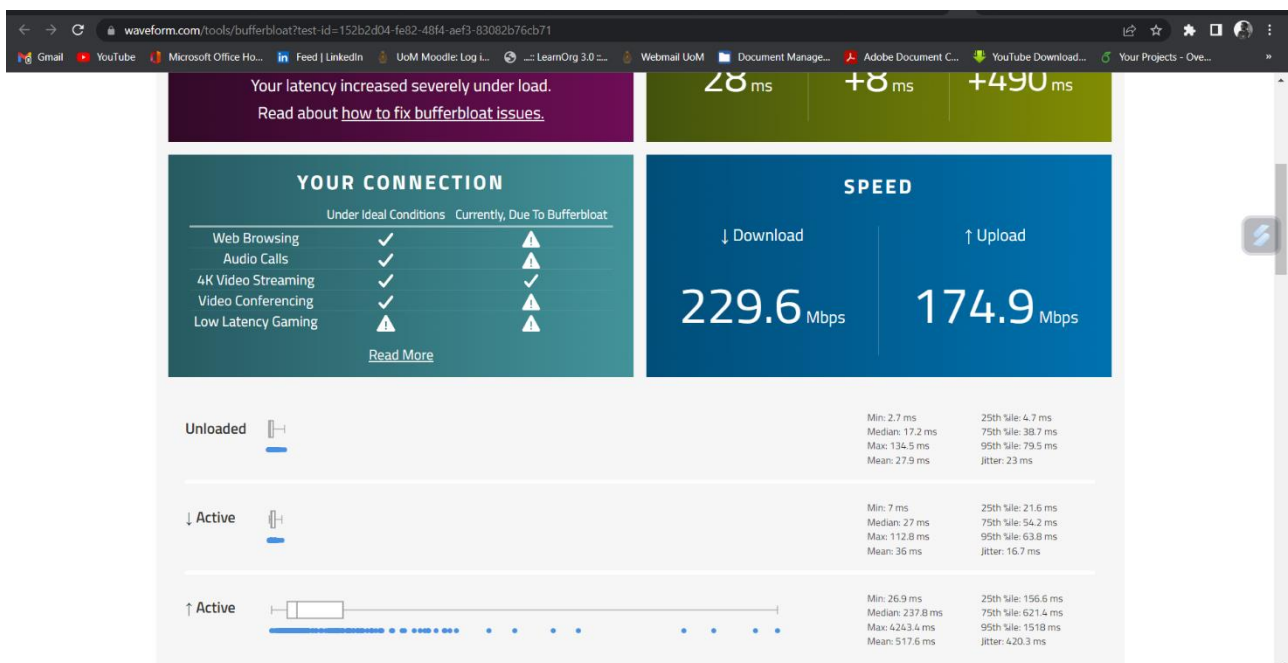

- **User experience:** In applications that require real-time interaction, such as online gaming or video conferencing, even small amounts of latency can have a noticeable impact on the user experience. Latency can cause delays in voice or video transmission, making conversations or gameplay feel sluggish or unresponsive.
- **Network performance:** Latency can also affect the overall performance of a network. High latency can lead to slow data transfer rates, packet loss, and network congestion, which can impact the ability of users to access and use network resources.
- **Financial transactions:** In financial applications, such as trading platforms, even a small delay in data transmission can have significant financial consequences. Latency can impact the accuracy of stock prices and transaction times, which can result in lost profits or other financial impacts.
- **Cloud computing:** Many cloud-based applications and services rely on low-latency network connections to provide fast and responsive performance. High latency can impact the performance of these applications and make them feel slow or unresponsive.
- **SEO:** Latency also plays a role in website search engine optimization (SEO). Search engines such as Google consider website speed and responsiveness as part of their ranking algorithms, which means that websites with lower latency are likely to perform better in search results.

Performing Bufferbloat latency test,

- **During Off-Peak Traffic Time**
